Agenda

1

Introduction

Rethinking asset information management

2

Demo

Seamless information exchange in construction projects

3

Evolving usage

Innovative usage scenarios

Datafication

FROM DOCUMENTS TO DATA

Documents still rule

Large infra projects use up to 10M documents

Manual processes

Computers offer tremendous potential

Move towards data

Computers understand data, not text

Datafication

EASIER SAID THAN DONE

Black hole

Data without data model are unusable

Data models hard-coded

Data models cannot be exchanged

Knowledge graphs

Knowledge graphs represent data **and** data model

RDF

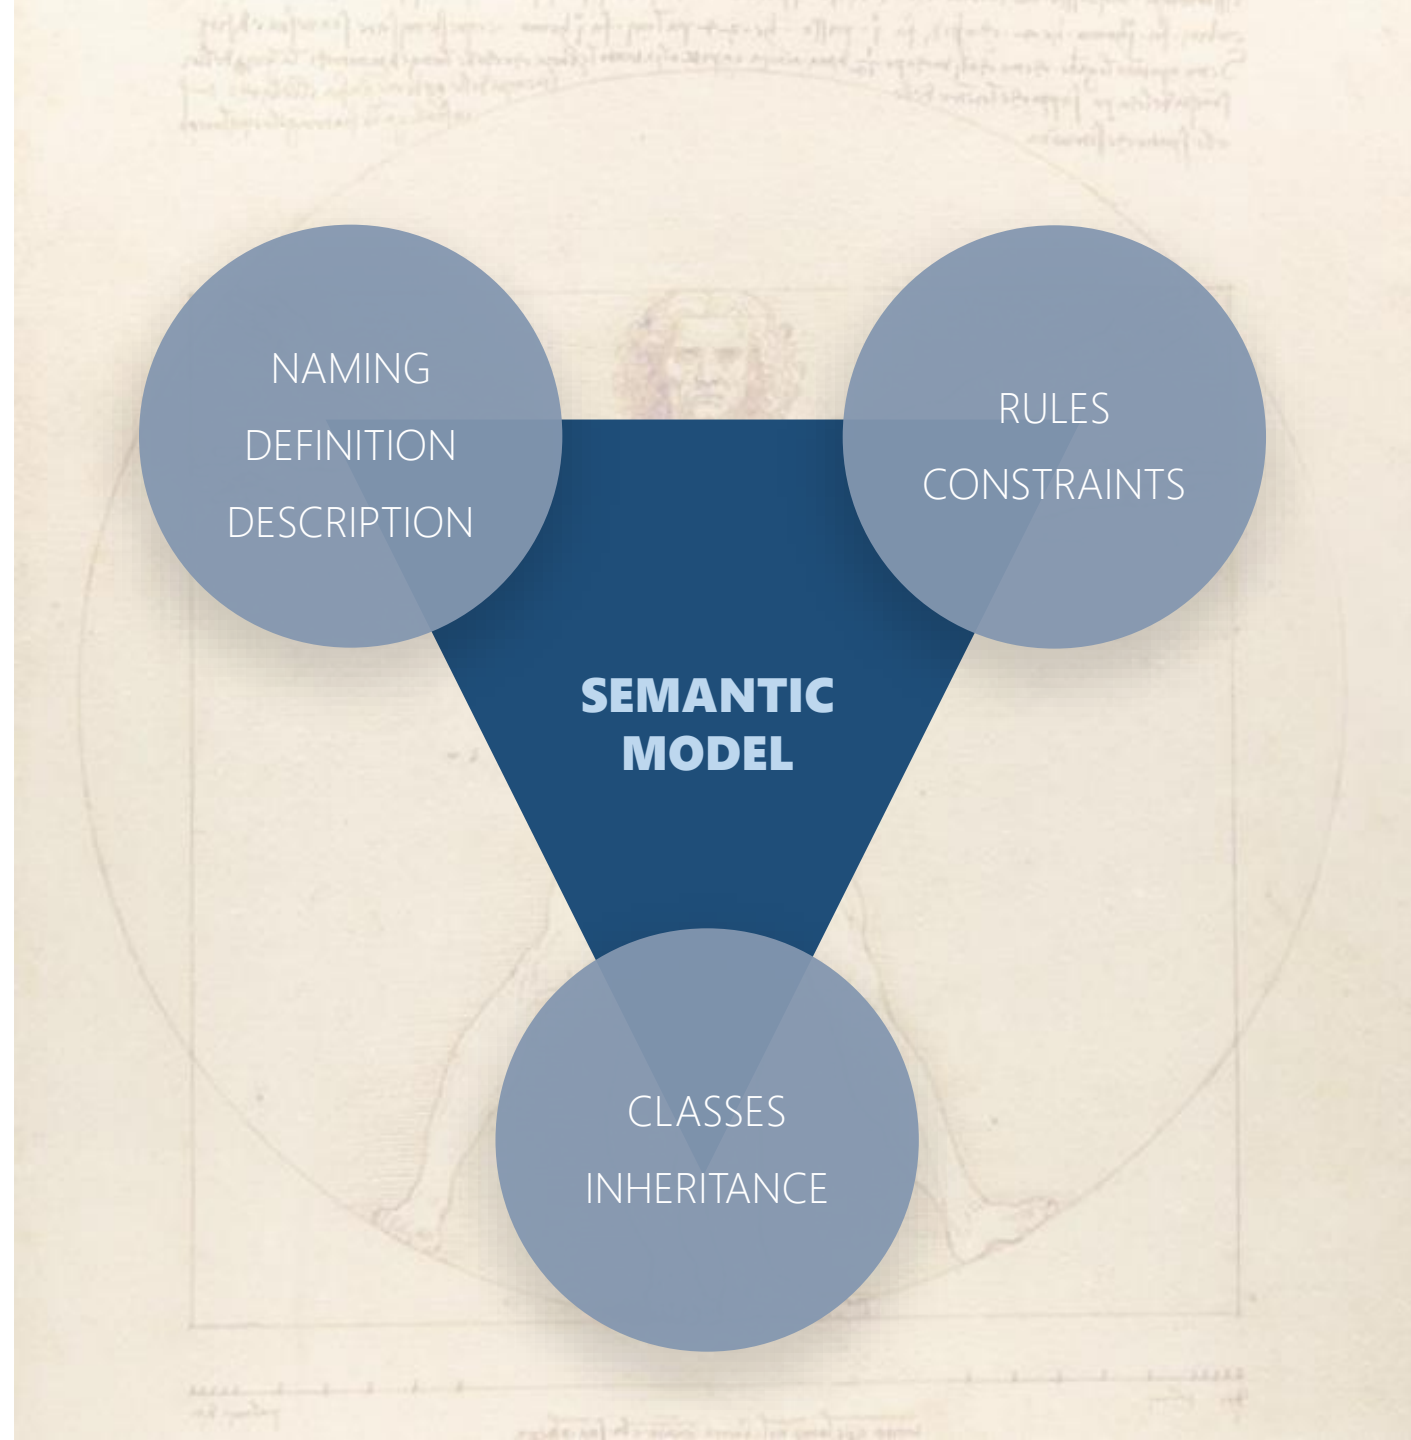

Exchanging data models

Importance of data models

Data models provide semantics so that computers “understand” data

Semantic triangle

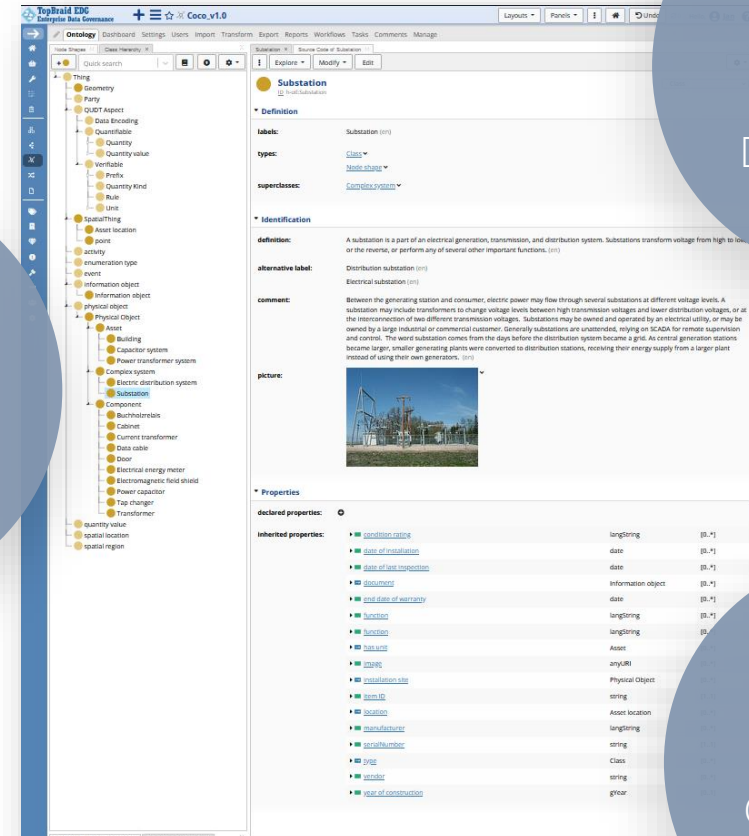

Class hierarchy, definition, constraints

▼ Identification

definition: A substation is a part of an electrical generation, transmission, and distribution system. Substations transform voltage from high to low, or the reverse, or perform any of several other important functions. (en)

alternative label: Distribution substation (en)
Electrical substation (en)

description: Between the generating station and consumer, electric power may flow through several substations at different voltage levels. A substation may include transformers to change voltage levels between high transmission voltages and lower distribution voltages, or at the interconnection of two different transmission voltages. Substations may be owned and operated by an electrical utility, or may be owned by a large industrial or commercial customer. Generally substations are unattended, relying on SCADA for remote supervision and control. The word substation comes from the days before the distribution system became a grid. As central generation stations became larger, smaller generating plants were converted to distribution stations, receiving their energy supply from a larger plant instead of using their own generators. MAPPING RULES

HOW MAPPINGS ARE GENERATED

Simple similarity of labels

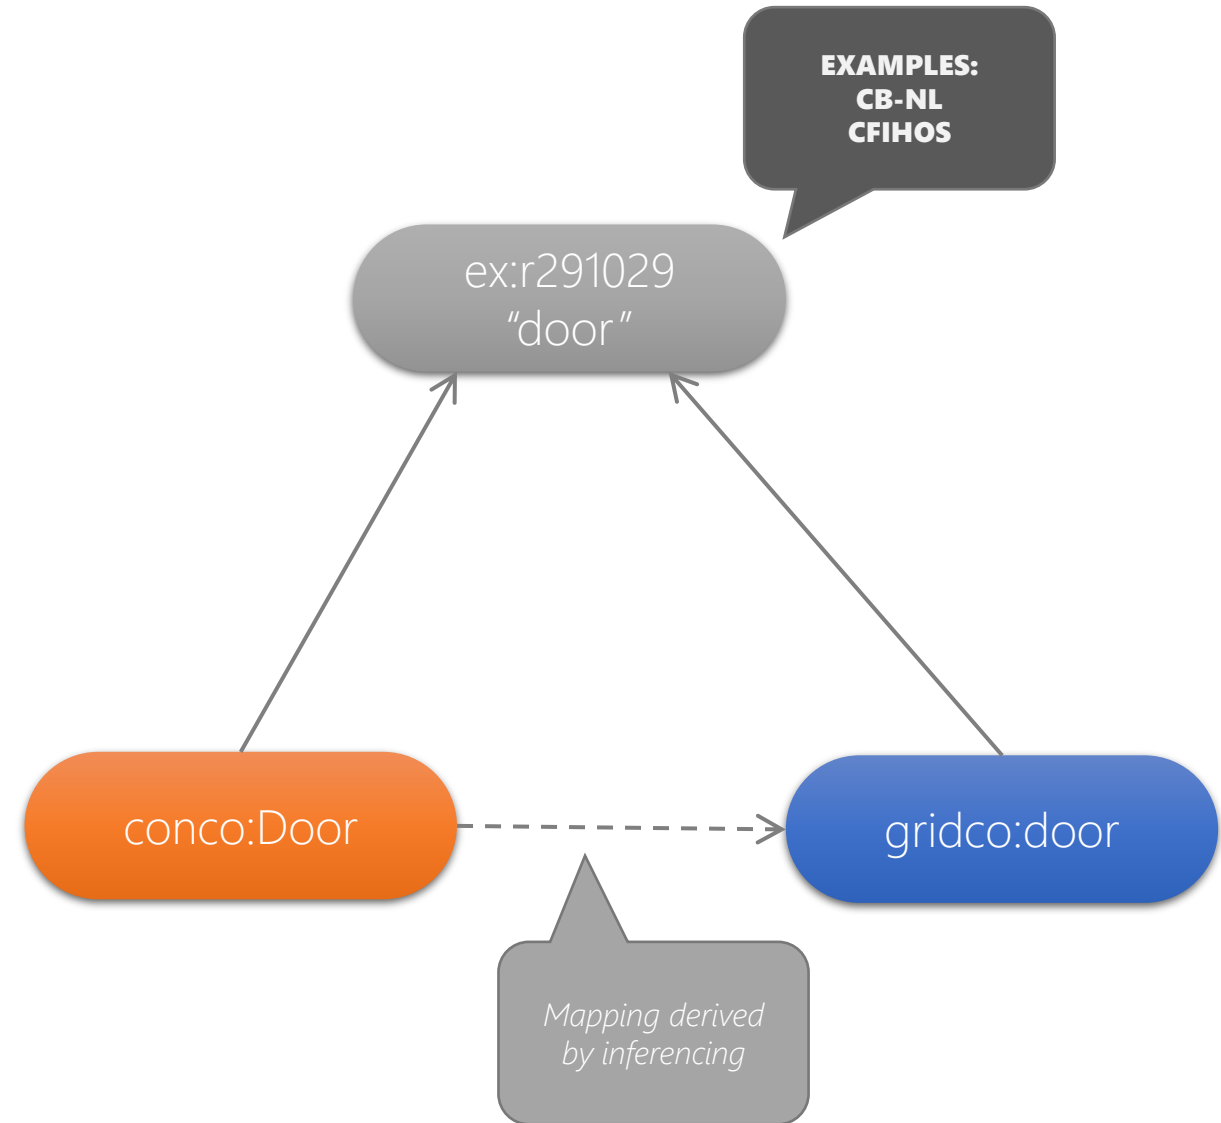

This is used in the demo

Adding more labels

More matches (also false positives)

Third party taxonomies

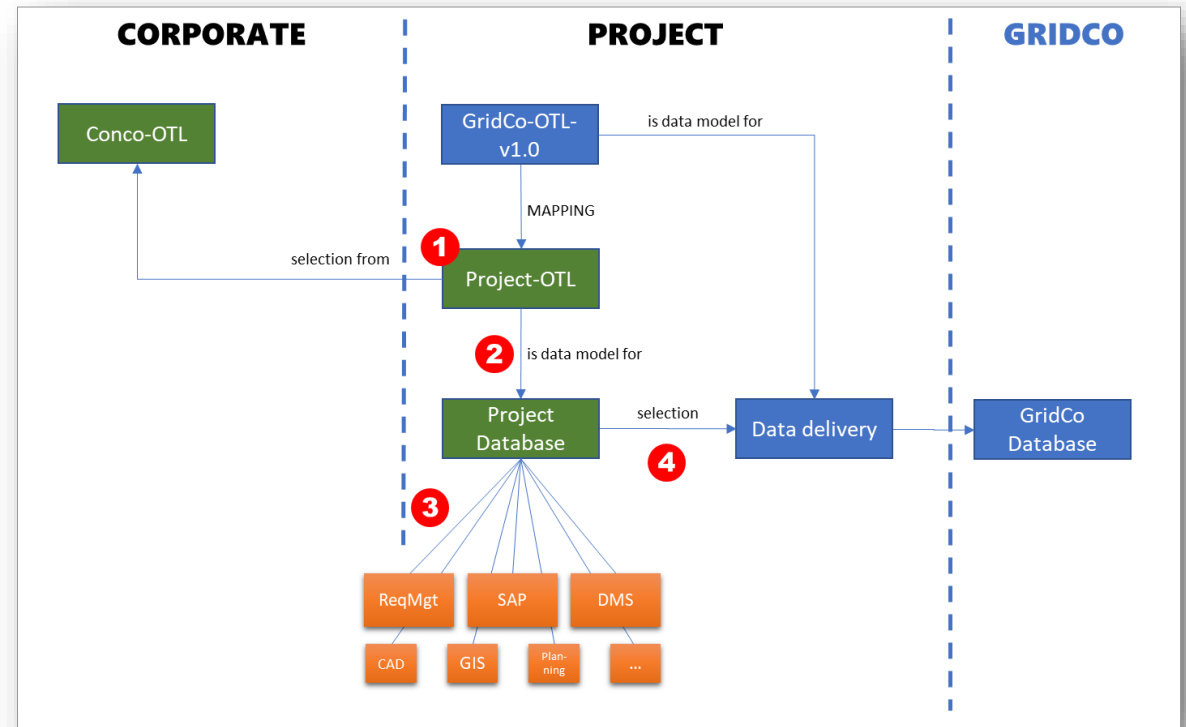

Transitive closure

Unified approach

Combining graphs

- 1 Project OTL**
Combining two OTLs and mappings
- 2 Project database**
Conco-OTL is the leading model
- 3 Integration with back-end IT**
Interfaces reusable across projects
- 4 Data delivery**
Reusable SHACL Rules for executing the mapping rules

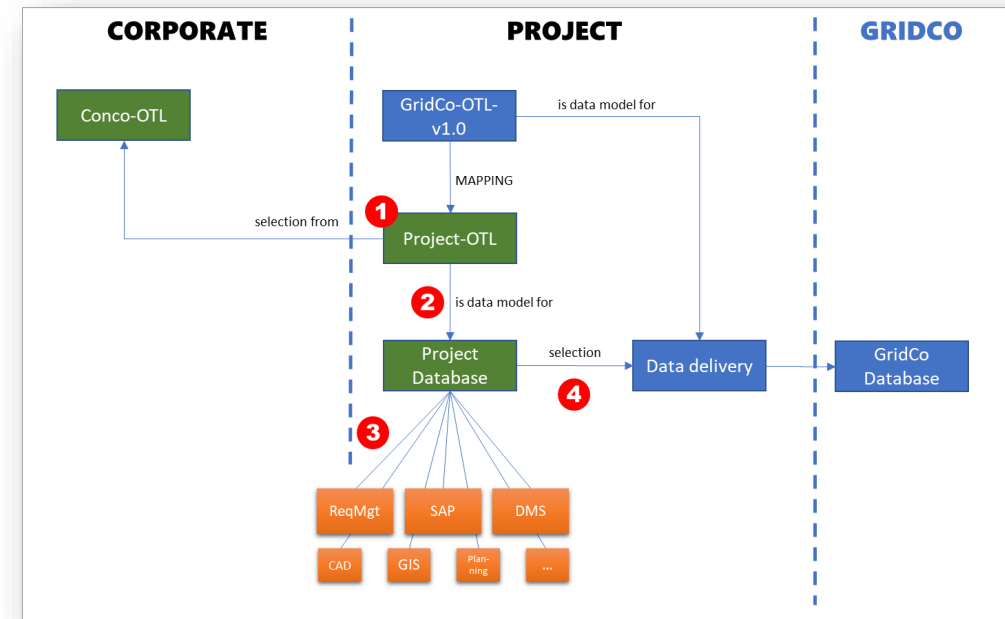

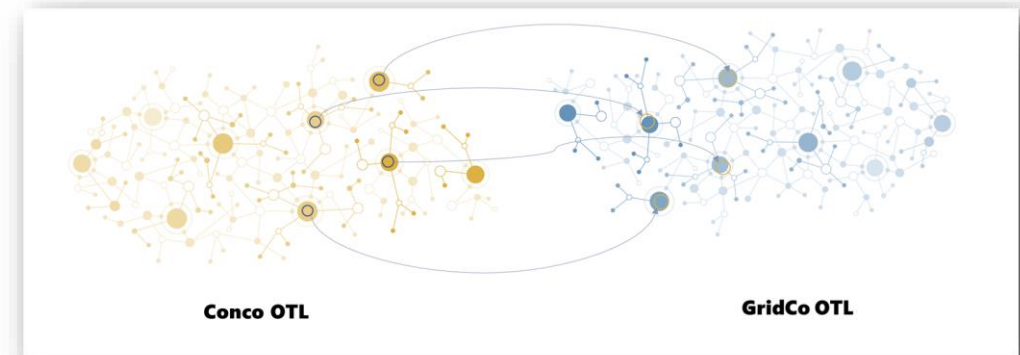

TAKE-AWAYS

Key points

- ❖ One standardized work process
- ❖ Based on mappings
- ❖ Data integration across projects

**Knowledge graphs crucially
express data and data models
in a unified way**
